

## Exercise 14.3

### Question 1:

Name any two figures that have both line symmetry and rotational symmetry.

#### Answer 1:

Circle and Square.

### Question 2:

Draw, wherever possible, a rough sketch of:

- (i) a triangle with both line and rotational symmetries of order more than 1.
- (ii) a triangle with only line symmetry and no rotational symmetry of order more than 1.
- (iii) a quadrilateral with a rotational symmetry of order more than 1 but not a line symmetry.
- (iv) a quadrilateral with line symmetry but not a rotational symmetry of order more than 1.

#### Answer 2:

- (i) An equilateral triangle has both line and rotational symmetries of order more than 1.

Line symmetry:

Rotational symmetry:

**(Chapter – 14) (Symmetry)**  
**(Class – VII)**

- (ii) An isosceles triangle has only one line of symmetry and no rotational symmetry of order more than 1.

Line symmetry:

Rotational symmetry:

- (iii) It is not possible because order of rotational symmetry is more than 1 of a figure, most ascertain the line of symmetry.
- (iv) A trapezium which has equal non-parallel sides, a quadrilateral with line symmetry but not a rotational symmetry of order more than 1.

Line symmetry:

Rotational symmetry:

*(Chapter – 14) (Symmetry)*  
(Class – VII)

**Question 3:**

In a figure has two or more lines of symmetry, should it have rotational symmetry of order more than 1?

**Answer 3:**

Yes, because every line through the centre forms a line of symmetry and it has rotational symmetry around the centre for every angle.

**Question 4:**

Fill in the blanks:

Shape	Centre of Rotation	Order of Rotation	Angle of Rotation
<b>Square</b>			
<b>Rectangle</b>			
<b>Rhombus</b>			
<b>Equilateral triangle</b>			
<b>Regular hexagon</b>			
<b>Circle</b>			
<b>Semi-circle</b>			

**Answer 4:**

Shape	Centre of Rotation	Order of Rotation	Angle of Rotation
<b>Square</b>	Intersecting point of diagonals.	4	90°
<b>Rectangle</b>	Intersecting point of diagonals.	2	180°
<b>Rhombus</b>	Intersecting point of diagonals.	2	180°
<b>Equilateral triangle</b>	Intersecting point of medians.	3	120°
<b>Regular hexagon</b>	Intersecting point of diagonals.	6	60°
<b>Circle</b>	Centre	infinite	At every point
<b>Semi-circle</b>	Mid-point of diameter	1	360°

**(Chapter – 14) (Symmetry)**  
**(Class – VII)**

**Question 5:**

Name the quadrilateral which has both line and rotational symmetry of order more than 1.

**Answer 5:**

Square has both line and rotational symmetry of order more than 1.

Line symmetry:

Rotational symmetry:

**Question 6:**

After rotating by  $60^\circ$  about a centre, a figure looks exactly the same as its original position. At what other angles will this happen for the figure?

**Answer 6:**

Other angles will be  $120^\circ, 180^\circ, 240^\circ, 300^\circ, 360^\circ$ .

For  $60^\circ$  rotation:

It will rotate six times.

**(Chapter – 14) (Symmetry)**  
**(Class – VII)**

For 120° rotation:

It will rotate three times.

For 180° rotation:

It will rotate two times.

For 360° rotation:

It will rotate one time.

**(Chapter – 14) (Symmetry)**  
**(Class – VII)**

### Question 7:

Can we have a rotational symmetry of order more than 1 whose angle of rotation is:

- (i)  $45^\circ$                       (ii)  $17^\circ$  ?

### Answer 7:

- (i) If the angle of rotation is  $45^\circ$ , then symmetry of order is possible and would be 8 rotations.
- (ii) If the angle of rotational is  $17^\circ$ , then symmetry of order is not possible because  $360^\circ$  is not complete divided by  $17^\circ$ .
